

DATS 6203 Project Proposal

Lydia Jin, Xi Qian, Yuyang Wang,

Our group has decided on an image classification problem. We're interested in further application of the image classification we learned in class. We have chosen to use the IAM Handwriting Dataset from Kaggle, which is a collection of handwritten passages by various writers. The goal of this project is to use deep learning to classify the writers by their writing styles. The results of this project can be used in future applications, such as identifying criminals by signature in fraudulent cases.

The dataset contains approximately 5000 image files, which is large enough for us to train a deep network. However, the size of all images is different, so files that are selected to be used in the modeling part should be processed. This project will utilize the standard form of the Convolutional Neural Network (CNN) deep network. The frameworks to implement this network are Keras, and TensorFlow. Keras is very useful for constructing deep neural networks in solving image recognition, image classification problems. Keras is also easy to use, and the best for deep learning models with stacked layers.

We will be utilizing knowledge on CNN from class notes and relevant code from course material. Further references have been listed below.

We will measure the network performance using the accuracy and training loss. The accuracy was calculated by finding the percentage of correctly classified cases.

Schedule:

Data Pre-Processing	Modeling	Evaluation (Paper/Presentation)
April 8th	April 17th	April 20th
